TITLE: Concerning the problem of a transparent contact for II-VI
type photoconductors ~~20,44~~

SOURCE: Ukrayins'kyy fizychnyy zhurnal, v. 11, no. 1, 1966, 40-44

TOPIC TAGS: cadmium sulfide, cadmium compound, photoconductor,
photoconductivity, single crystal, optic property, electric property,
metal vapor deposition, volt ampere characteristic

ABSTRACT: The authors discuss the possibility of using CdO films as
transparent ohmic contacts for CdS-type photoconductors. The contact
properties of CdS single crystals and films with CdO films were in-
vestigated, along with the optical and electrical properties of CdO
films. The films were obtained by cathode sputtering of metallic

Card 1/2

I. 20950-66

cadmium in a low vacuum under the following conditions: cathode diameter -- 6 cm, cathode-anode distance -- 1.6 -- 1.8 cm, current -- 50 to 70 mA, voltage -- 600 V, air pressure -- 0.4 to 0.65 torr. Under these conditions the polycrystalline films were deposited at a rate of 500 -- 600 Å/min. The resistivity of CdO films measured by the four-probe method amounted to $(3.2 \text{ -- } 6.4) \times 10^{-3}$ ohm-cm, which does not contradict the data in the literature, and was temperature independent between -100 and 70C. The spectral dependence of the transmission coefficient was obtained. The volt-ampere characteristics of CdS films with CdO contacts were obtained at various temperature and illuminations. An investigation of the distribution of the potential along the CdS film with CdO contacts showed that the gradient of the potential decreases near the contacts. These results and also data on the noise characteristics of the contacts indicate that they are ohmic. Orig. art. has: 4 figures and 1 table.

TITLE: Measurement of the energy of separation of an electron-hole pair and of the absolute quantum yield of the x-ray conductivity of single crystals of cadmium sulfide and cadmium selenide

SOURCE: Ukrayins'kyy fizichnyy zhurnal, v. 11, no. 1, 1966, 49-52

TOPIC TAGS: cadmium sulfide, cadmium selenide, single crystal, quantum yield, x-ray effect, pair production

ABSTRACT: The authors have determined the absolute quantum yield of x-ray conductivity and the separation energy of an electron-hole pair by comparative measurements of the photo and x-ray conductivity of single crystals of cadmium sulfide and cadmium selenide. In the cadmium sulfide the conductivity was excited by light with a wavelength of 5100 Å and monochromatic copper K_α radiation; in cadmium selenide

the wavelength of the exciting light was 7180 Å and monochromatic copper K_α radiation. In each case these wavelengths corresponded to identical absorption coefficient.

cients. The setup for measuring the quantum yield of the x-ray conductivity was calibrated in quanta with the aid of a MSTR-5 counter with a known efficiency in the x-ray region, and a standard photocell in the visible region. For CdS the x-ray quantum yield was found to be $(1.8 \pm 0.06) \times 10^3$ electrons per absorbed quantum and the separation energy was found to be 4.96 ± 0.17 ev. For CdSe the obtained values were $(2.1 \pm 0.02) \times 10^3$ and 4.22 ± 0.02 respectively. The separation energies are in good agreement with the empirical formula of K. A. McKay (Phys. Rev. 84, 829, 1951).

TITLE: Investigation of the correlation of the photo- and x-ray
sensitivity of single crystals of the cadmium sulfide type

SOURCE: Ukrayins'kyy fizichnyy zhurnal v. 11, no. 1, 1966, 53-58

TOPIC TAGS: cadmium sulfide, cadmium selenide, single crystal, x ray
effect, photoconductivity, electric conductivity, absorption
coefficient, quantum yield

ABSTRACT: The authors investigated the correlation between the x-ray
and photoconductivity of CdS, CdSe, and CdS_xCdSe_{1-x} single crystals.

The measurements were performed using monochromatic x rays of wave-
length 1.540 Å and visible radiation for which the crystals had equal Z

Card 1/2

L 20949-66

ACC NR: AP6006762

absorption coefficients. For CdS this corresponds to visible radiation with a wavelength 5100 Å, and for CdSe to 7180 Å. The points of a plot of the stationary x-ray sensitivity as a function of the stationary photosensitivity fall close to a straight line, indicating correlation between the sensitivities. A similar plot obtained in measurements using the continuous x-ray and visible spectra resulted in a great scatter of points. This is interpreted as not being due to the absence of correlation, but rather to the inadequate conditions of excitation of CdS and CdSe single crystals when using the continuous spectra. A comparison between the phenomenological quantum yields of the photo- and x-ray conductivity of CdS and CdSe single crystals indicates that good agreement exists between the values of the quantum yields of the photocurrent and the x-ray conductivity, giving rise to the correlation of the stationary sensitivities. Orig. art. has: 2 figures and 2 tables.

TITLE: Investigation of the chromium-niobium-molybdenum system

SOURCE: AN UkrSR. Dopovid, no. 4, 1964, 492-498

TOPIC TAGS: phase diagram, alloy, chromium alloy niobium containing alloy,
molybdenum containing alloy

ABSTRACT: The conflicting data in the literature and the incomplete investigations of phase equilibria in the chromium-niobium-molybdenum system stimulated the present authors to subject 125 ternary and 100 binary alloys to chemical analysis. Fusion analyses were carried out in the following manner. The excess gas pressure was determined by the method of the absorption of water vapor. The infrared spectrum was recorded with a KBr disk and also in the powdered samples. The infrared spectra of the samples were recorded in the solid state and the results were compared with the corresponding spectra of the pure elements. The results of the infrared spectra are given in the tables.

TITLE: Latest achievements in the field of corrosion-resistant alloys with high nickel contents

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 3, 1962, 324, abstract 3I175. (Zašt. mater. v. 9, no. 2, 1961, 69-76)

TEXT: The anti-corrosion properties of a number of Ni-base alloys are examined. It is noted that the Corronel 230 alloy, which contains 65% Ni and 35% Cr, has high corrosion resistance (CR) in HNO_3 , and in mixtures of HNO_3 and HF, at high temperatures. An alloy containing 55% Ni and 45% W has similar properties. An alloy containing 40% Ni and 60% Cr has a higher CR under the action of fuel ash at 820-1100°C. The sensitivity of components made of standard Ni-Mo alloys (64% Ni, 28% Mo, 5% Fe) to intergranular corrosion in hot HCl vapor can be greatly reduced by heat treating these alloys after welding. The same effect is achieved if 2% V is introduced into the composition of the alloy, the Fe content reduced to
